Tweet

We asked a Swift ToO campaign on the FSRQ PKS 1313-333 ($z=1.21$), triggered by prolonged High Energy activity detected with FERMI-LAT. The trigger method detected activity at $E > 20\text{GeV}/(1+z)$ with $TS \sim 79$ from 2015-12-10 to 2015-12-30, following the prescription of Pacciani et al. 2014, ApJ, 790, 45.

FERMI-LAT detected Two Gamma-ray photons of about 50 GeV within the last week.

The flux integrated on the whole period is $(7.9\pm 1.7)E^{-9} \text{ ph cm}^{-2} \text{ s}^{-1}$ ($E > 3 \text{ GeV}$), to be compared to a catalog flux of $(0.47\pm 0.07)E^{-9} \text{ ph cm}^{-2} \text{ s}^{-1}$ ($E > 3 \text{ GeV}$).

The Swift Follow-up revealed the source in high state in optical/UV and X-ray.

The preliminary Swift-UVOT photometry on 2015-12-27 is (in AB photometric system):

v: 15.86+-0.03
b: 16.20+-0.02
u: 16.60+-0.02
w1: 17.33+-0.02
m2: 17.51+-0.03
w2: 17.85+-0.02

1 of 2

4/29/20, 19:31

Magnitudes have not been corrected for Galactic extinction.

These photometric data correspond to the brightest obtained with Swift-uvot observations.

On 2015/12/29 the source showed a flux about 20% fainter in optical/UV.

For comparison, on 2005/09/07, the UVOT measured magnitudes were:

v: 18.59+-0.18

b: 19.60+-0.27

u: 19.87+-0.13

w1: 20.62+-0.12

m2: 20.87+-0.11

w2: 21.07+-0.09

The simultaneous Swift-XRT observation on 2015/12/27 gives a photon index 1.44+-0.21 (90% c.l.), an unabsorbed flux of (2.5+-0.3)E-12 erg/cm2/s which is the brightest detected with swift-XRT.

We encourage further multi-wavelength observations. We thank the Swift team and Swift Observatory Duty Scientist for rapidly scheduling our observations.
