10 SALT spectra of HE 0435-4312

(Sredzinska+, 2017)

SALT long-slit spectroscopy of HE 0435-4312:
fast displacement in the Mg II emission line.

Keywords: accretion, accretion disks -
black hole physics, emission line, quasar - individual: HE 0435-4312

Abstract:
The MgII emission line is visible in the optical band for intermediate redshift quasars ($0.4 < z < 1.6$) and it is thus an extremely important tool to measure the black hole mass and to understand the structure of the Broad Line Region.

We aim to determine the substructure and the variability of the MgII line with the aim to identify which part of the line comes from a medium in Keplerian motion.

Using the Southern African Large Telescope (SALT) with the Robert Stobie Spectrograph (RSS) we performed ten spectroscopic observations of quasar HE 0435-4312 ($z=1.2231$) over a period of three years (Dec 23/24, 2012 to Dec 7/8, 2015). Both the MgII line and the FeII pseudo-continuum increase with time. We clearly detect the systematic shift of the MgII line with respect to the FeII over the years, corresponding to the acceleration of $104 \pm 14 \text{ km/s/year}$ in the quasar rest frame. The MgII line shape is clearly non-Gaussian but single-component, and the increase in line equivalent width and line shift is not accompanied with significant evolution of the line shape. We analyse the conditions in the MgII and FeII formation region and we note that the very large difference in the covering factor and the turbulent velocity also support the conclusion that the two regions are spatially separated. The measured acceleration of the line systematic shift is too large to connect it with the orbital motion at a distance of the Broad Line Region (BLR) in this source. It may imply a precessing inner disk illuminating the BLR. Further monitoring is still needed to better constrain the variability mechanism.

Description:
Ten spectra of the quasar HE 0435-4312 taken at different dates with SALT telescope. Spectra are in the rest frame, corrected for the Galaxy extinction.
The ten spectra are taken on 23 Dec 2012, 18 Feb 2013, 20 Aug 2013, 3 Feb 2014, 23 Aug 2014, 24 Nov 2014, 9 Jan 2015, 9 Aug 2015, 6 Oct 2015, 7 Dec 2015.

Objects:

RA	(2000)	DE	Designation(s)
04 37 11.78	-43 06 04.3		HE 0435-4312 = HE 0435-4312
